

Data Sheet / Data Highway: Knowledge Hosted Back-up Solutions

Data Highway Services:-

- MS File & Print Services
- MS AD Directory Services
- MS Exchange Email Services
- MS SQL Database Services
- Desktop Configurations
- Desktop Applications
- Many Other Leading Applications

Our Powerful Online Backup Services can safeguard your valuable data. Data Highway is a dynamic and scalable off-site data replication service that provides organisations with the ability to replicate and store business critical data, safely and securely to one of Knowledge's highly-available Data Centre facilities.

Powerful data compression technology allows large amounts of business data to be transferred at high speed over a variety of common communications links including ADSL, SDSL, Private, Ethernet & IP-VPN circuits.

Military strength (448-bit) data encryption provides over-the-wire data protection ensuring all business data is securely protected at all times during the electronic transfer process.

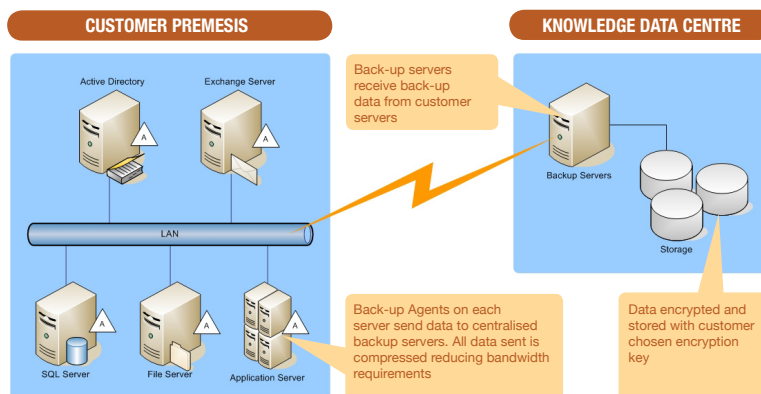

On receipt of your data, all information is permanently encrypted into your data silos using high security crypto keys. The crypto key is known only to your organisation and provides you with exceptional levels of data security and protection.

All Data Highway services are delivered to ISO 9001 Quality Management standards and our Data Centre services conform to the ISO 27001 Information Security standard. ITIL accredited service delivery managers complete the cycle of quality to ensure that the organisation receives a first class service delivered to International Standards.

Data Highway Services comes in three service packages: Business Standard, Business Premium, Business Enterprise.

Data Highway – Business Standard

The Business Standard service utilises locally installed server agents which encrypt and send business data directly from the host server(s) to the Data Centre for archive.

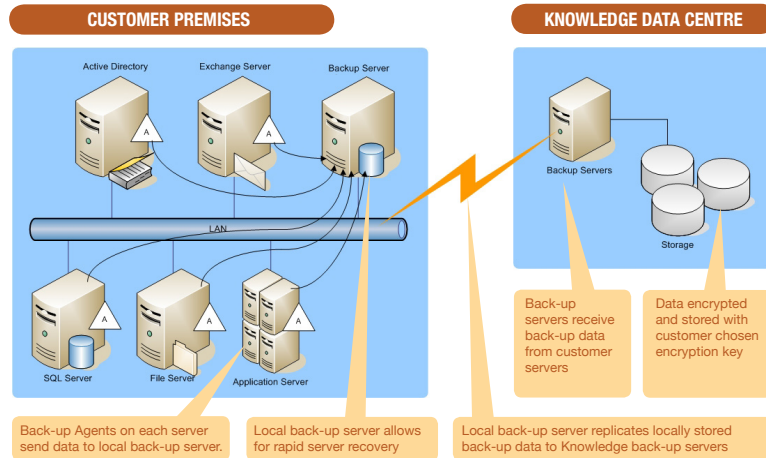

Introducing Nexent

The Nexent Communications Technology Platform (CTP) converges local, regional and national network infrastructures into one, single point of service which eliminates multiple service provider costs, simplifies service delivery and reduces ongoing network management and support overheads. Nexent network services are delivered to the highest industry standards, conforming to ISO9001, ISO27001 and ITIL based processes and are located in fault resilient data centres across the network. Quality comes as standard with the use of industry leading infrastructure equipment and multiple service providers for absolute communications resilience.

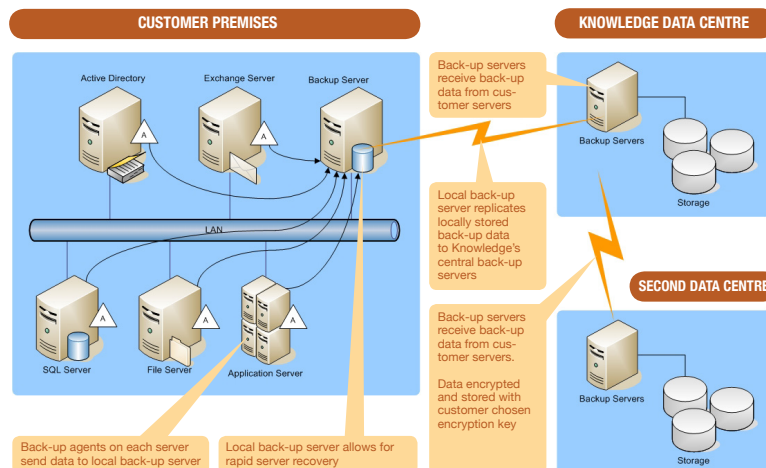

Data Highway – Business Premium

The Business Premium service provides organisations with additional levels of data integrity and protection at the LAN level. The Business Premium service provides for a locally installed Data Achieve server, which acts as a centralised staging point for multi-server backups and allows for the rapid recovery of data from localised server of data failures.

Data Highway – Business Enterprise

The Business Enterprise service provides the same functionality as the Business Premium service but with the added functionality of SAN-to-SAN high availability data protection. Critical business data is replicated to two geographically independent SAN and Data Centre infrastructures to provide the ultimate in data protection solution.
